

Insert Interval (medium)

We'll cover the following

- Problem Statement
- Try it yourself
- Solution
- Code
 - Time complexity
 - Space complexity

Problem Statement

Given a list of non-overlapping intervals sorted by their start time, **insert a given interval at the correct position** and merge all necessary intervals to produce a list that has only mutually exclusive intervals.

Example 1:

Input: Intervals=[[1,3], [5,7], [8,12]], New Interval=[4,6]

Output: [[1,3], [4,7], [8,12]]

Explanation: After insertion, since [4,6] overlaps with [5,7], we merged them into one [4,7].

Example 2:

Input: Intervals=[[1,3], [5,7], [8,12]], New Interval=[4,10]

Output: [[1,3], [4,12]]

Explanation: After insertion, since [4,10] overlaps with [5,7] & [8,12], we merged them into [4,12].

Example 3:

Input: Intervals=[[2,3],[5,7]], New Interval=[1,4]

Output: [[1,4], [5,7]]

Explanation: After insertion, since [1,4] overlaps with [2,3], we merged them into one [1,4].

Try it yourself

Try solving this question here:

Java

Python3

JS

C++

```
1 def insert(intervals, new_interval):
2
3     merged = []
4     intervals = insert_interval(intervals, new_interval)
5     start, end = intervals[0]
6     for i in range(1, len(intervals)):
7         interval = intervals[i]
8         if interval[0] <= end:
9             end = max(interval[1], end)
10        else:
11            merged.append([start, end])
12            start = interval[0]
13            end = interval[1]
14    merged.append([start, end])
15    # TODO: Write your code here
16    return merged
17
18 def insert_interval(intervals, new_interval):
19     for i in range(len(intervals)):
20         if intervals[i][0] > new_interval[0]:
21             intervals.insert(i, new_interval)
22     return intervals
```

```
23 intervals.append(new_interval)
24 return intervals
25 def main():
26     print("Intervals after inserting the new inter
27     print("Intervals after inserting the new inter
28     print("Intervals after inserting the new inter
```

Output

0.24s

```
Intervals after inserting the new interval: [[1, 3], [4, 7], [8, 12]]
Intervals after inserting the new interval: [[1, 3], [4, 12]]
Intervals after inserting the new interval: [[1, 4], [5, 7]]
```

Solution

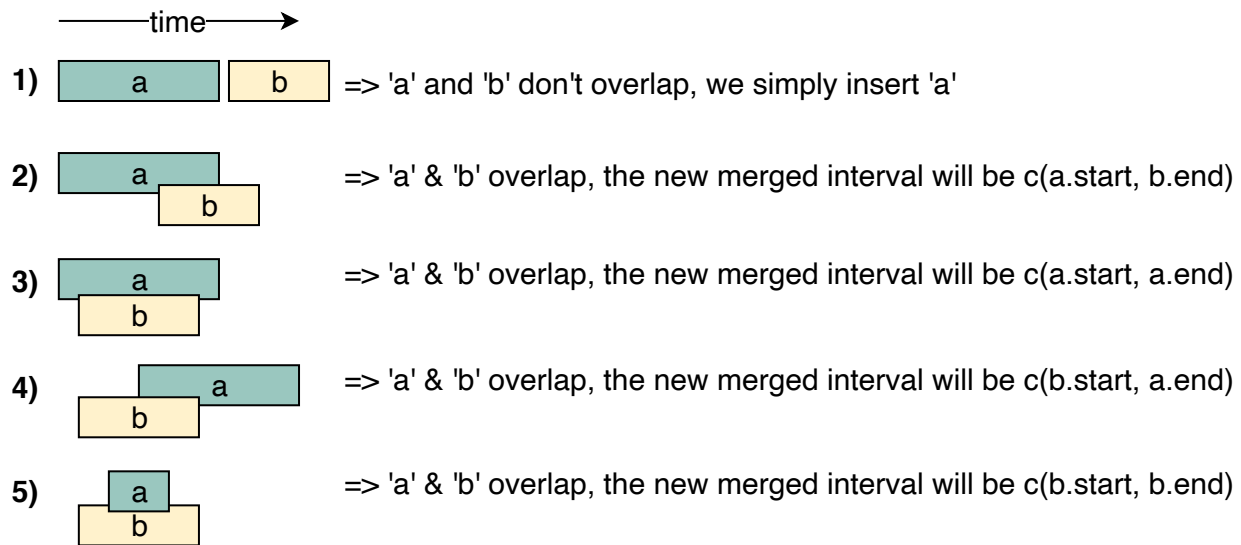

If the given list was not sorted, we could have simply appended the new interval to it and used the `merge()` function from Merge Intervals (<https://www.educative.io/collection/page/5668639101419520/5671464854355968/5652017242439680/>). But since the given list is sorted, we should try to come up with a solution better than $O(N * \log N)$

When inserting a new interval in a sorted list, we need to first find the correct index where the new interval can be placed. In other words, we need to skip all the intervals which end before the start of the new interval. So we can iterate through the given sorted listed of intervals and skip all the intervals with the following condition:

```
intervals[i].end < newInterval.start
```

Once we have found the correct place, we can follow an approach similar to Merge Intervals (<https://www.educative.io/collection/page/5668639101419520/5671464854355968/5652017242439680/>)

968/5652017242439680/) to insert and/or merge the new interval. Let's call the new interval 'a' and the first interval with the above condition 'b'. There are five possibilities:

The diagram above clearly shows the merging approach. To handle all four merging scenarios, we need to do something like this:

```
c.start = min(a.start, b.start)
c.end = max(a.end, b.end)
```

Our overall algorithm will look like this:

1. Skip all intervals which end before the start of the new interval, i.e., skip all intervals with the following condition:

```
intervals[i].end < newInterval.start
```

2. Let's call the last interval 'b' that does not satisfy the above condition. If 'b' overlaps with the new interval (a) (i.e. $b.start \leq a.end$), we need to merge them into a new interval 'c':

```
c.start = min(a.start, b.start)
c.end = max(a.end, b.end)
```

3. We will repeat the above two steps to merge 'c' with the next overlapping interval.

Code

Here is what our algorithm will look like:

Java	Python3	C++	JS
<pre>1 def insert(intervals, new_interval): 2 merged = [] 3 i, start, end = 0, 0, 1 4 5 # skip (and add to output) all intervals that 6 while i < len(intervals) and intervals[i][end] 7 merged.append(intervals[i]) 8 i += 1 9 10 # merge all intervals that overlap with 'new_i 11 while i < len(intervals) and intervals[i][star 12 new_interval[start] = min(intervals[i][start 13 new_interval[end] = max(intervals[i][end], r 14 i += 1 15 16 # insert the new_interval 17 merged.append(new_interval) 18 19 # add all the remaining intervals to the outpu 20 while i < len(intervals): 21 merged.append(intervals[i]) 22 i += 1 23 return merged 24 25 26 def main(): 27 print("Intervals after inserting the new inter 28 print("Intervals after inserting the new inter</pre>			
<div> </div>			

Time complexity

As we are iterating through all the intervals only once, the time complexity of the above algorithm is $O(N)$, where 'N' is the total number of intervals.

Space complexity

The space complexity of the above algorithm will be $O(N)$ as we need to return a list containing all the merged intervals.
